Abstract

Purpose – This study aims to examine the influence of organizational citizenship behavior's sub-constructs including altruism, civic virtue, sportsmanship, conscientiousness and courtesy on knowledge sharing behavior (KSB). It also pays attention to the effects of group emotional climate on the relationship between organizational citizenship behavior and knowledge sharing.

Design/methodology/approach – This research was conducted based on the quantitative research strategy by applying structural equation modeling. Using a random sampling method, this research surveyed 116 participants and analyzed the data via partial least equation modeling.

Findings – The results claim that altruism, conscientiousness and civic virtue have a significant effect on KSB, while the relationship between courtesy and sportsmanship with KSB were not significant. Furthermore, the findings depict that positive and negative workgroup emotional climate would impede or enhance KSB among people with a high level of altruism, conscientiousness and civic virtue.

Practical implications – Given the importance of knowledge sharing in the today knowledge economy, by comprehending the influence of group organizational citizenship behavior's sub-constructs on knowledge sharing, managers would improve organizational knowledge sharing by developing a culture encouraging altruism, conscientiousness and civic virtue as a substitute for incentive pay. Moreover, promoting an emotionally supportive climate fosters knowledge sharing within people.

Originality/value – This study makes three distinct additions to the knowledge sharing literature. First, although there are little studies that investigate the relationship between organizational citizenship behaviors (OCB) and KS, a few of them examine the effects of OCB's sub-constructs on KS behavior. Second, this is one of the first studies that examined the moderating role of workgroup emotional climate regarding knowledge sharing. Finally, examining the effect of OCB's sub-constructs on KS in an Iranian public sector would contribute to the literature by broadening the examination of the constructs in a different context.

Keywords Knowledge management, Knowledge sharing behaviour, Organizational citizenship behaviour, Workgroup emotional climate

1. Introduction

Undoubtedly knowledge is one of the most significant organizational resources that would create a sustainable competitive advantage in the knowledge economy (Gelard *et al.*, 2014; Philsoophian *et al.*, 2016). It is accounted as a valuable asset that should be managed by knowledge processes- such as acquiring, developing, storing, sharing and re-using- systematically to improve organizational performance. One of the crucial and most

challenging processes of knowledge management is knowledge sharing (Dehghani *et al.*, 2015). The main reason is that knowledge sharing is a multifaceted construct that lots of factors influence its occurrence, such as the nature of shared knowledge (Arpaci and Balo, 2016), people motivation to share their knowledge (Suder *et al.*, 2017), attitudes and intentions (Dehghani *et al.*, 2015), opportunities to share (Ipe, 2003), culture (Foss *et al.*, 2010), psychological aspects (Teh and Yong, 2011; Afshar-Jalili and Ghaleh, 2018), behavioral aspects (Hsien *et al.*, 2014), and etc.

Organizations can derive several benefits from a well-established knowledge sharing, such as human resource improvement, market development and penetration, improving management-employee relations, individual, workgroup and organizational performance and productivity improvement, enhancing organizational learning and innovation (Connelly and Kelloway, 2003; Tohidinia and Mosakhani, 2010).

While knowledge sharing can result in many organizational improvements, lack of knowledge sharing can make severe issues for organizations (Lin, 2008). Therefore, predicting employees' propensity to share their knowledge is recognized as a high priority of organizational obsession in the knowledge economy.

Although the importance of knowledge and knowledge sharing is perceived in most organizations, managers still have difficulties to enforce people sharing their knowledge (Chow and Chan, 2008). Indeed, knowledge sharing will not happen if people do not tend to share their knowledge with their colleagues or other workgroup members. Knowledge sharing matters are correspondingly common in most organizations (Siemens *et al.*, 2008; Ho *et al.*, 2009). Moreover, individuals often perceive their knowledge as the most important reason that their organizations need them, and thus, prefer to hoard it rather than share it. Keeping knowledge for themselves is a natural tendency (Davenport and Prusak, 1998). To address this problem, rather than focusing on formal reward systems, which is extrinsic incentives, other behaviors, such as organizational citizenship behaviors (OCB) that may support individual knowledge sharing in the organizational context, can be taken into account. Because these behaviors can play a role in encouraging people to share their knowledge as intrinsic motivation. OCB is recognized as discretionary work behaviors that are not linked directly to organizational formal reward system (Organ, 1988), but improves organizational performance. This research tends to pay particular attention to group OCB and its sub-constructs to examine the extent they can predict knowledge sharing behaviors (KSBs). Because, OCBs may substitute for incentive pay for enhancing knowledge sharing (Wasko and Teigland, 2004). Although the aggregation of varied and rich research on knowledge sharing has provided useful insights, there have been a few attempts to deeply investigate its relationship with group OCB (Pei-Lee and Hongyi, 2012).

On the other hand, empirical experiences reveal that emotions can influence directly on people behaviors. OCBs as discretionary work behaviors are not exceptional. Despite the importance of emotions in determining employee's organizational behaviors (Härtel *et al.*, 2008), little theory or research is available, which investigates the influence of workgroup emotional climate (WEC) on OCB and KSB deeply. This research investigates the impact of workgroup emotional climate on the relationship between OCB's sub-constructs and KSB, which would be one of the first attempts in this context. This study revealed the reason that people with high OCBs level may still prefer not to share their knowledge.

Investigating WEC as a moderator of the relationship between group OCB and KS for the first time, this paper has three other aspects that make it distinctive from other studies conducted in this area. First, although some studies investigate the relationship between group OCB and KS, few of them examine separately the effects of OCB's sub-constructs in predicting KS behavior. Moreover, it is one of the first studies examining the effect of OCB's

sub-constructs on KS in an Iranian public sector. A successful public company was chosen as the population of this research that would help to examine the mentioned relationships in the Iranian context. Finally, examining the effect of OCB's sub-constructs on KS in an Iranian public sector would contribute to the literature by broadening the examination of the constructs in a different context.

In the following sections, the literature on knowledge sharing, group OCB and workgroup emotional climate are reviewed. Next, the research methodology, which was used in this study is described, and it is followed by presenting and discussing the results and findings of the statistical analysis. Finally, both the implications and limitations of this research are explained as a conclusion.

2. Literature review and hypotheses development

2.1 Knowledge sharing

Knowledge sharing has drawn significant attention from researchers in the managerial field (Foss *et al.*, 2010); however, there is no consensus on the definition of knowledge sharing. In most research knowledge sharing has described as the informal communication process involving the flow of knowledge among individuals (Siemsen *et al.*, 2008). Knowledge sharing is also characterized as behavior by, which individuals provide their unique knowledge and experiences to others voluntarily (Hansen and Avital, 2005). Connelly and Kelloway (2003) described knowledge sharing as a set of behaviors including the exchange of knowledge or assistance to others. The common points in all definitions are that knowledge sharing is considered as behavior that it cannot be forced by managers and formal task systems. On the other hand, knowledge sharing has a discretionary nature. People choose whether they want to involve in knowledge sharing and how much knowledge and experience they intend to share (Gagne and Deci, 2005). These characteristics are similar to those in organizational citizenship behaviors.

2.2 Group organizational citizenship behavior

About three decades have passed since Organ and his colleagues first draw the term "OCB" (Organ, 1988). OCB encompasses individual behaviors that are discretionary, not directly recognized by the formal reward system but are beneficial to the organization and, in general, promote organizational performance. A conducted meta-analysis study depicted that OCB has both individual-level outcomes (e.g. reward allocation decision) and organizational level outcomes (e.g. productivity) (Podsakoff *et al.*, 2000). However, the majority of OCB research has been conducted on an individual level (Euwema *et al.*, 2007). Considering the increasing focus on team works and workgroups, the importance of studying group OCB is growing (Ehrhart and Naumann, 2004). Group OCB- also known as unit-level OCB, team citizenship behavior, team OCB or collective citizenship behavior (Euwema *et al.*, 2007)- implies the normative level of OCB presented in a team or workgroup (Ehrhart, 2004). Group OCB is defined as "the overall level of group members' behavior that contributes to the maintenance and enhancement of the social and psychological context of the group that facilitates its task performance" (Borman and Motowidlo, 1997).

Group effectiveness may occur by group members engaging in OCBs such as helping their colleagues to perform their tasks and providing handy suggestions to improve their performance. Abu Bakar and McCann (2016) even went further and claimed that OCB construct itself is a multi-level construct and it is OCB in the aggregate, and not an individual instance of OCB, which impacts organizational effectiveness (Schnake and Dumler, 2003). Taking the Organ (1988) definition of OCB into account, we characterized group OCB as "group members" behaviors that are discretionary, not directly recognized by

the formal reward system but are beneficial to the group and, in general aggregately promotes the organizational performance.”

2.3 Group organizational citizenship behaviors and KSB

According to [Hsu and Lin \(2008\)](#) individuals with higher OCB are more open to sharing their knowledge with their colleagues. [Pei-Lee and Hongyi \(2012\)](#) claimed that OCB positively relates to KSBs and individuals with higher OCB have more willing to increase the welfare of others; thereby in return, they will have more tendencies to share their knowledge. A research was conducted in the catering enterprises validated the positive effects of OCB on KSB ([Hsien et al., 2014](#)). [Mogotsi et al. \(2011\)](#) declared that KSB is a type of organizational citizenship behavior and the antecedents of OCB would also be antecedents of KSB. They believe that knowledge sharing and OCB are closely related because both behaviors are taken into account as a discretionary behavior, and both have a positive relationship with organizational performance.

2.4 Workgroup emotional climate

Emotion, as a complex and structured phenomenon, is an affective response to what happens in the environment. It is a cognitive representation of the event's meaning for an individual ([Frijda and Mesquita, 1994](#)). Emotion is the outcome of assessing situations, and thus, that is the result of individual emotional characteristics interacting with environmental characteristics ([Liu and Härtel, 2013](#)). According to the cognitive appraisal theories of emotion, emotional work events influence occupational attitudes and behaviors ([Härtel et al., 2008](#)).

Emotions are constructed in the social context ([Frijda and Mesquita, 1994](#)). As workgroups have been conceptualized as social entities, emotions are expected to be constructed in the workgroup context as well. Considering the importance of emotions in forming organizational attitudes and behaviors, some researchers have turned their attention to the study of WEC, which is characterized as the perception of the emotions and emotional exchanges typifying a given group ([Liu and Härtel, 2013](#)). The concept of WEC relies on affective events theory (AET; [Weiss and Cropanzano, 1996](#)) and intergroup emotions theory (IET; [Mackie et al., 2000](#)), which implies that:

Events or objects that impinge on the in-group are appraised for their emotional relevance, and specific patterns of appraisals then produce emotional reactions that arise from group identification and membership ([Smith et al., 2007](#)).

[Sandelands and St. Clair \(1993\)](#) claimed that workgroup members develop shared emotions while they are performing their tasks, and thus, individual-level emotional experiences combine to form the aggregative emotion of the workgroup. Considering the positive contribution of WEC in workgroup performance, which, in turn, contributes to the organizational performance, it is a worthwhile construct to be noticed further in organizational studies.

According to [Liu et al. \(2014\)](#), two dimensions were deployed to define WEC. The first one is valence, which often referred to in classification as pleasure and displeasure or positive and negative, is an essential dimension of subjective experience. Next is the interpersonal dimension. While emotions are not only just personal bodily states but also social phenomena, they can be differentiated as other-focused (emotions associated with interpersonal engagement) and ego-focused (emotions associated with individual states and interpersonal disengagement). Combining two dimensions, we would have four different types of WEC including ego-focused positive climate (EP), ego-focused negative climate

(EN), other-focused positive climate (OP) and other-focused negative climate (ON) (Liu *et al.*, 2014).

2.5 Hypotheses development

For intensely studying the relationship between group OCB and KS, the sub-constructs of OCB should be identified first. Organ (1988) introduced five components of OCB, which are vastly applied in OCB studies. *Altruism* is the first component, which is characterized as *discretionary behaviors that have the effect of helping another specific person with an organizational relevant task or problem*. Altruism is related to selfless concern for others' welfare (Shukia and Singh, 2013). In the context of altruism, knowledge sharing is a discretionary behavior that helps others to perform their tasks more productive. Knowledge sharing also helps new personnel to fit into the new job or environment effectively, and that is the reason it is related to altruism (Lin, 2008). Hsu and Lin (2008) claimed that altruism includes knowledge sharing with passion. From these findings, the following hypotheses can be drawn for this OCB dimension:

H1. Altruism has a positive impact on knowledge sharing.

Courtesy is the next OCB component, which encompasses *behaviors such as being mindful of the effects and consequences of one's behavior on other people and trying to avoid making them problems* (Organ, 1988). One shows courtesy by respecting the rights of others in the workplace (Shukia and Singh, 2013). Lin (2008) Justified that knowledge sharing is influenced by courtesy. The prior conducted studies investigating the relationship between courtesy and KSB support this hypothesis (Lin, 2008; Ramasamy and Thamaraiselvan, 2011). Based on these discussions, the following hypothesis is derived.

H2. Courtesy has a positive impact on knowledge sharing.

Civic virtue is another OCB component, which is *constructively involved in organizational processes and procedures, going beyond the minimum required by an individual's immediate job* (Lin, 2008). It has two critical features including:

- (1) going beyond mandatory elements of the job; and
- (2) keeping oneself abreast of changes in the organization (Organ, 1988).

As knowledge sharing encompasses developing and sharing ideas and experiences, stronger civic virtue typically leads to foster knowledge sharing (Ramasamy and Thamaraiselvan, 2011). As a result, knowledge sharing is hypothesized to be affected by civic virtue, and thus, the following hypothesis is derived.

H3. Civic virtue has a positive impact on knowledge sharing.

Conscientiousness, the fourth component is described as *being sincere, punctual, honest and dependable in the workplace* (Shukia and Singh, 2013). Such persons adhere to organizational rules and regulations strictly (Organ, 1988), and thus, if knowledge sharing is part of organizational regulations we would expect that highly conscientiousness people respect to it and share their knowledge actively (Farh *et al.*, 2004). What this says is that the nature of conscientiousness without considering personal benefits can influence knowledge sharing. Lin (2008) revealed that employees with a strong conscientiousness are likely to share their knowledge, which is also supported by the same research conducted in three different universities in India (Ramasamy and Thamaraiselvan, 2011). Hence, conscientiousness is

hypothesized to be related to knowledge sharing. From the mentioned findings, the following hypothesis can be drawn for this component.

H4. Conscientiousness has a positive impact on knowledge sharing.

Finally, *sportsmanship* includes behaviors focusing on what is right rather than wrong (Organ, 1988). Employees with sportsmanship *do not focus on minor issues at the workplace and believe in marching ahead, without complaining*. They prefer to focus on the positive aspects (Shukia and Singh, 2013). Highly sportsmanship implies a good team member willing to share knowledge with others (Lin, 2008). Employees may be motivated to share their knowledge by sportsmanship to improve undesirable circumstances for achieving team or organizational success (Ramasamy and Thamaraiselvan, 2011). Based on the above discussions, the following hypothesis can be drawn.

H5. Sportsmanship has a positive impact on knowledge sharing.

Moreover, there is some research reveal that knowledge sharing and organizational citizenship behaviors are affected by WEC. Veitch and Griffitt (1976) depicted that there is a positive relationship between positive affect and cooperativeness. The other research illustrated the relationship between positive affect and helping behavior, which it could be called as altruism in OCB literature (Isen and Baron, 1991). Another WEC study found that workgroup emotional climate is a predictor of organizational citizenship behavior (Liu et al., 2014).

On the other hand, there is a relationship between positive affect and prosocial behaviors (Lee and Allen, 2002), such as knowledge sharing. The findings of a study shown that the team members have more tendency to share their knowledge in case they are happier with their colleagues (Constant et al., 1994), which accents the importance of people emotional situation on knowledge sharing. Correspondingly, it could be deduced that WEC can affect the relationship between OCB and KS. Considering the dimensions of WEC, including positive workgroup emotional climate and negative workgroup emotional climate, the following hypotheses are proposed:

H6a. Negative WEC moderates the relationship between group OCB's components and knowledge sharing, such that group OCB's components have a weaker positive effect on knowledge sharing when members have a higher level of negative WEC.

H6b. Positive WEC moderates the relationship between group OCB's components and knowledge sharing, such that group OCB's components have a stronger positive effect on knowledge sharing when members have a higher level of positive WEC climate.

The research model including the hypotheses is depicted in Figure 1.

3. Methodology

3.1 Population introduction

Khuzestan Regional Electric Co (KZREC) was established in 1958 in the southern part of Iran, Khuzestan province. KZREC is responsible for power generation management and providing stable and reliable electric power in the geographic region, within an area of 81,000 square km, including more than seven million consumers. According to the successful KM implementation in this company, it is selected as the population of this research.

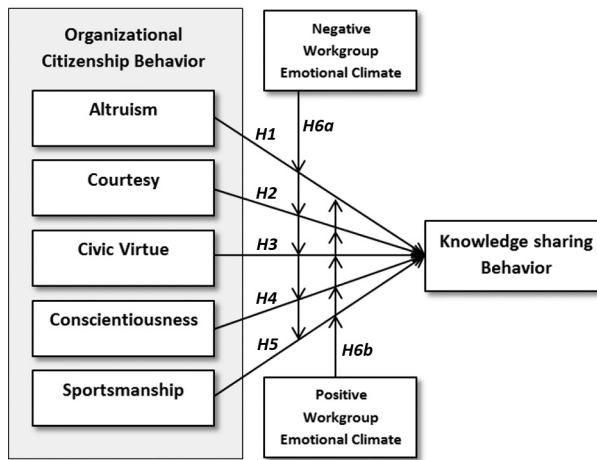

Figure 1.
The research model

3.2 Methodology

This research used a quantitative method to understand the extent that OCB can predict KS behaviors. For this aim, the first step after identifying the population was determining the sample size for the study. Accordingly, the following information was used for calculating the proper sample size for the research: significant level = per cent 5, minimum $R^2 = 0.1$ and maximum numbers of arrows pointing at a construct = 5. Considering this information, the research sample size of 147 was calculated (Cohen, cited by [Hair et al., 2013](#)). To get better collaboration from the employees, first the organization HR director was approached, and the purpose and outcomes of the research were described. Once he agreed to collaborate, a focal point was assigned for distributing the questionnaires to be filled. Receiving filled questionnaires, 116 participants returned their filled questionnaire that means the return rate was per cent 77. All the returned filled questionnaires were acceptable, and the missing data were filled by using SPSS.

3.3 Measures

All the measures, detailed in [Appendix](#), were presented in Persian to the population. While translating to Persian, the recommended translation and back-translation procedures ([Brislin, 1980](#)) were performed.

Workgroup Emotional Climate: for measuring WEC the 16-item version of WECS ([Liu et al., 2014](#)) was deployed. Response options ranged from (1) “strongly disagree” to (5) “strongly agree.” The Scale assessed four dimensions of WEC encompasses EN, OP, ON and EP. Two samples of the items are “the members of the team are not very enthusiastic toward work” and “this team is characterized as a relaxed, easy-going working climate.”

Knowledge Sharing: for measuring KS the seven-item scale ([Lin, 2007](#)) was used. Response options ranged from (1) “strongly disagree” to (5) “strongly agree.” Two samples of the items are “knowledge sharing among colleagues is considered normal in my team” and “Colleagues in my team share knowledge with me when I ask them to.”

Group OCB: for measuring Group OCB the 24-item scale ([Podsakoff et al., 1990](#)) was applied, which assessing five group OCB dimensions including altruism, sportsmanship, courtesy, conscientiousness, and civic virtue. Getting experts' opinion via CVR forms, the number of questions decreased to 15-items. Response options ranged from (1) “strongly

disagree” to (5) “strongly agree.” Two samples of the items are “My teammates always focus on what’s wrong, rather than the positive side” and “My teammates consider the impact of their actions on coworkers.”

4. Data analysis and results

Analyzing research data, first, we checked the adequacy of data by performing the Kaiser–Meyer–Olkin measure of sampling adequacy index (KMO), and then the measurement and structural models were examined. The KMO analysis resulted in 0.826, which is significantly higher than the threshold value of 0.7 (George and Mallery, 2003). Therefore, the result confirms that the data set is adequate for conducting SEM analysis.

Assessing the measurement and structural model, we used the partial least equation modeling (PLS-SEM) technique via Smart PLS software V.2.3.6. Considering the advantages of PLS in analyzing intricate research models including several moderators, this approach was chosen (Reinartz *et al.*, 2009).

4.1 Measurement model

Confirmatory factor analysis (CFA) is applied to evaluate the overall measurement model. To evaluate the validity of the measurement model, both convergent and discriminant validity were assessed. Convergent validity is the degree to which items used to measure the same conceptual agreement. For determining convergent validity, composite validity (CR), the average variance extracted (AVE) and the factor loadings were calculated (Hair *et al.*, 1998). In this regard, the factor loadings and CR should exceed 0.7 (Chin, 1998) and 0.5 is the minimum acceptable extend for AVE (Fornell and Larcker, 1981). The demonstrated data in Table I explain that the results of the measurement model exceed the recommended values, and hence, it indicates the adequate convergent validity of the model.

Moreover, to assess the convergent validity of each construct, the standardized factor loading (outer loading) of each item of each construct was calculated. The loadings are recommended to exceed 0.7 for convergent validity (Anderson and Gerbing, 1998; Hair *et al.*, 1998). Although the factor loading of item KS-01 is just below 0.7, considering other acceptable validity and reliability indexes it could be accepted.

Discriminant validity is also should be examined in the measurement model. It refers to the degree to which factors that are supposed to measure a specific construct do not predict conceptually unrelated criteria (John and Benet-Martinez, 2000). To evaluate the discriminant validity, the square root of AVEs should exceed the cross-constructs correlations (Fornell and Larcker, 1981). In Table II, the calculated square root of AVEs was listed. As it is shown, the amounts are higher than the correlation coefficient values with any other construct, and therefore, verifying the discriminant validity of the model.

The discriminant validity is confirmed whenever the root of the AVE between each pair of factors is higher than the correlation estimated between factors (Hair *et al.*, 2013). In Table III, the loadings of each item related to each construct are calculated. The comparison of cross-loadings in both Tables III and IV, shows that the loadings of an indicator are higher than other loadings for its construction, which indicates adequate discriminant validity.

For more investigation of discriminant validity, HTMT index was also calculated. Table IV depicts that all the values are less than the threshold of 0.9 (Henseler *et al.*, 2015). Hence, it proves that discriminant validity exists between the latent variables and the measurement model is reliable and valid.

Larcker criterion

4.2 Structural model

Testing structural model and hypotheses, this research used Smart PLS. The primary criterion for structural model assessment is R^2 . This criterion represents the amount of explained variance of each endogenous latent variable (Hair *et al.*, 2012). This amount is categorized into three levels including weak, moderate and substantial to which the amount of R^2 is 0.19, 0.33 or 0.67, respectively (Chin *et al.*, 2003). Table VI presents that the justified R^2 of the structural model is 0.414, which indicates that the structural model predicts KSB in

an acceptable way. Furthermore, blindfolding was run for the endogenous latent construct in the model to calculate the Q^2 index. While the Q^2 amount, 0.248, is considerably higher than 0, the quality of the prediction of the structural model is acceptable (Hair *et al.*, 2013). Table V represents the amount of R^2 and Q^2 .

The final results extracted from analyzing the structural model were presented in Table VI and Figure 2. The findings reveal that the relationship between altruism and KSB is significant (path coefficient = 0.351, t -values = 3.761), which asserts that $H1$ was supported. Likewise, the relationship between conscientiousness and KSB is significant (path coefficient = 0.578, t -values = 5.161), and hence, $H4$ was supported. Next, the relationship between civic virtue and KSB were significant (path coefficient = 0.191, t -values = 2.254), which claims that $H3$ was also supported. The structural model does not support both $H2$ and $H5$.

Considering the results of the structural model assessment presented in Table VII, we examined the moderating role of the positive workgroup emotional climate (positive WEC),

and negative WEC variables on the supported hypotheses, including the effect of altruism, conscientiousness and civic virtue on KSB. For this purpose, the interaction method was applied in Smart PLS. The first interaction variable, called AI-NWEC assessed the moderating role of Negative WEC on the effect of altruism on KSB. Likewise, Cn-NWEC and CV-NWEC have been respectfully investigated the moderating role of the negative WEC on

Endogenous latent variables	R^2	R^2 adjusted	Q^2
KSB	0.439	0.414	0.248

Notes: R^2 Value 0.19 = weak, 0.33 = moderate, and 0.67 = substantial; Q^2 value = effect size: 0.02 = small; 0.15 = medium; 0.35 = large

Table V.
 R^2 and Q^2 value

Hypothesis	Path	Effect direction	t -value	Result
H1	Altruism > KSB	Positive	2.761**	Supported
H2	Courtesy > KSB	Negative	0.393	Not supported
H3	Civic virtue > KSB	Positive	2.254*	Supported
H4	Conscientiousness > KSB	Positive	5.161**	Supported
H5	Sportsmanship > KSB	Negative	0.566	Not supported

the relationship between conscientiousness and civic virtue with KS. On the other hand, Al-PWEC, Cn-PWEC and CV-PWEC are the interaction variables investigating the moderating role of the positive WEC on the relationship between altruism, conscientiousness and civic virtue on KS. Table VII illustrated the analyzed findings.

Investigating Table VII relating to the moderation analysis reveals that by improving positive workgroup emotional climate in the organization, the effect of altruism, conscientiousness and civic virtue on KSB increases significantly (t -values = 5.326, 8.261 and 10.233, respectively). However, by increasing negative WEC in the organization, the relationship between conscientiousness and civic virtue with KSB decreases remarkably (t -values = 2.593 and 4.870). The results deduce that workgroup emotional climate has a moderating effect on the relationship between the mentioned group OCB's sub-constructs and knowledge sharing. In other words, in the positive workgroup emotional climate (PWEC) we expect that people with a high level of altruism, conscientiousness, and civic virtue present more KSB. On the other hand, negative workgroup emotional climate (NVEC) adversely influences the KSBs. Nevertheless, NVEC is neutral regarding the relationship between altruism and KSB.

5. Discussion

This research examined that the sub-constructs of group organizational citizenship behaviors, including altruism, civic virtue, conscientiousness, sportsmanship and courtesy to what extent can predict KSB. Specifically, we tested the moderating role of workgroup emotional climate on the mentioned relationships. We found that only three out of five sub-constructs of OCB can predict KSB within or across workgroup members significantly. These sub-constructs are conscientiousness, altruism and civic virtue. The first one had the most influence on KSB.

Altruism refers to the tendency one may have to help his/her colleagues to address a task-relevant problem. Therefore, it is not unexpected that a person with high altruism has more propensity to share their knowledge to tackle someone's work-related issues that appear because of the knowledge insufficiency. Knowledge is a valuable resource; however, the result of research reveals that altruism, as a predictor of knowledge sharing, causes a person to share knowledge selflessly for others' welfare. This relationship was asserted by other scholars (Lin, 2008).

Hypothesis	Moderator name	Interaction variable	Effectuated relationship	Direction	<i>t</i> -value	Result
<i>H6a-1</i>	NWEC	Al-NWEC	Altruism > KSB	Negative	0.972	Not supported
<i>H6a-2</i>		Cn-NWEC	Conscientiousness > KSB	Negative	2.593*	
<i>H6a-3</i>		CV-NWEC	Civic virtue > KSB	Negative	4.870**	
<i>H6b-1</i>	PWEC	Al-PWEC	Altruism > KSB	Positive	5.326**	Supported
<i>H6b-2</i>		Cn-PWEC	Conscientiousness > KSB	Positive	8.261**	Supported
<i>H6b-3</i>		CV-PWEC	Civic virtue > KSB	Positive	10.233**	Supported

Notes: ** $p < 0.01$; * $p < 0.05$

Another OCB's sub-construct investigated in this research is conscientiousness. This construct is characterized as being honest and loyal in the workplace. Such a person adheres to organizational rules and regulations strictly. If KSBs are defined as organizational policy, they follow it rigorously. Considering that knowledge sharing is part of the task description for all people working in KZREC, the findings support the relationship between conscientiousness and KSB. [Farh et al. \(2004\)](#) also acknowledge the same results in their studies.

The last, but the same important OCB's sub-construct, which predicts KSB is civic virtue. This factor means going beyond mandatory tasks, as well as embracing organizational change. While KSB is part of a job, some people may concern it as extra work and that may result in not participating actively in it. Based on the findings of this research it is assumed that people with high civic virtue intention may go beyond their defined routine tasks and conduct KSB, even if it is not a part of their ordinary tasks. The relationship between civic virtue and KSB is defended by other scholars, such as [Ramasamy and Thamaraiselvan \(2011\)](#).

Analyzing the data gathered for the research refute the capability of courtesy and sportsmanship in predicting KSB. Courtesy means being mindful of the consequences of one's behavior on others life. Although one's knowledge may have a positive effect on others working life; however, the findings disprove the motivational role of courtesy to effectively pursuit people to share their knowledge in the organizational context. This conclusion contradicts the outcomes of some scholars; Nevertheless, [Dehghani et al. \(2015\)](#) experienced the same results in the Iranian context. Given the similar context of study in both research reveals that culture may moderate the relationship between courtesy and KSB.

The last OCB's sub-construct failing to be accepted as a significant predictor of KSB is sportsmanship, which means not to focus on organizational minor troublesome. Moreover, courtesy, sportsmanship was not recognized as a reason for stimulating KSB. This conventional finding may be rebutted by some research such as [Lin \(2008\)](#); nonetheless, considering the concept of sportsmanship, marching ahead without complaining, seems not to be directly related to the tendency for conducting KSB ([Dehghani et al., 2015](#)).

The findings also argue that the dominant emotional climate of the workgroup can affect the relationships between some sub-constructs of OCB and KSB among a workgroup. In this case, positive workgroup emotional climate enhances the relationship between mentioned constructs and KSB, while that negative workgroup emotional climate act adversely. Correspondingly, the more positive emotional climate is developed in the organization, the more KSB would be observed.

Reviewing the related literature, we found that this research is one of the first efforts toward investigating the impact of workgroup emotional climate on the relationship between group OCB's sub-constructs and KSB. Although some researchers have investigated the importance of corporate climate on promoting knowledge sharing ([William et al., 2013](#); [Matej et al., 2014](#)), a few of them have examined the emotional climate in knowledge sharing context. The results emphasize the importance of individual's emotional conditions in their workgroup, as well as their organization, by which it can influence conducting basic behaviors such as OCB ([Liu et al., 2014](#)) and KSB.

The findings of this study have some implications for managers and KMers. First, developing a culture, as a substitute for incentive pay, by which encourage altruism, civic virtue and conscientiousness would foster KSBs within or across teams and workgroups. The absence of these OCB's constructs in the workplace may decrease organizational knowledge sharing ([Wasko and Teigland, 2004](#); [Lin, 2008](#)). Therefore, managers should assess their organizational culture of altruism, civic virtue and conscientiousness and plan a

roadmap to enhance these sub-constructs. Not only this culture encouraging employees to increase the well-being of their co-workers (Niranjana and Pattanayak, 2005) but also it would enhance knowledge sharing.

Moreover, according to the adverse influence of negative emotional climate on conducting OCBs, as well as knowledge sharing, organizations must establish a feedback system to timely confront people dissatisfaction when it arises. This system would provide people an opportunity to freely express their thoughts and emotions before they turn into counterproductive behaviors. Through this feedback system, which may develop via the internet or intranet, managers can gather employee's recommendations and suggestions for improving the organizational emotional climate. Besides of the implication that these results have for KMers and organizations, the findings can call researchers for investigating what kind of interventions can improve altruism, civic virtue and conscientiousness within organizations.

This study encompasses some limitations, which can be addressed in future studies. First, actual knowledge sharing would be better to be observed rather than surveyed by a questionnaire (Lin and Ding, 2003). Second, this study surveyed employees in an Iranian company. Accordingly, the generalizability of the findings may be limited. The third limitation is that some other variables, such as job satisfaction, organizational culture, part-time or full-time working, gender, etc., were not addressed as control variables. Future studying should endeavor to overcome the limitations and other shortcomings by taking the mentioned variables as a moderator playing roles in the relationship between OCBs and KSBs. Finally, as another theoretical implication, considering the importance and influence of emotional climate on KS, KM researchers can study different consequences of this construct on knowledge management.

6. Conclusion

This research examined the influence of organizational citizenship behavior's sub-constructs on KSB. Besides, it noted the group emotional climate as a moderator on this relationship. Based on the findings, there are a significant relationship between some of the organizational citizenship behaviors including altruism, conscientiousness and civic virtue with KSB. In other words, it is expected that people with a high extent of the mentioned OCB have more intendency to share their knowledge. Moreover, organizations in which emotional climate is supported, enhance this relationship.

This study is one of the first investigating the relationship between all the OCB sub-constructs and KS. In addition, despite the importance of emotional climate on KSB, this construct is somehow neglected in KM literature. The results of this study, remark the importance of such constructs to enhance organizational knowledge sharing. Therefore, using these findings would help managers to encourage KS by emphasizing internal motives rather than external rewards.

As this model has been examined in only one organization, it is recommended that researchers investigate these findings in other organizations and evaluate the possible differences. Furthermore, using the other data gathering tools, such as observation, would improve the quality of findings, especially when KS behavior is assessed by future researchers.

Measure	Item code	Question
Knowledge sharing	KS-01	When I've learned something, I tell my colleagues about it
	KS-02	When they have learnt something new, my colleagues tell me something about it
Conscientiousness	KS-03	Knowledge sharing among colleagues is considered normal in my school
	KS-04	I share information with my colleagues when they ask for it
	Cn-01	Attendance at work is above the norm
	Cn-02	Does not take extra breaks
Sportsmanship	Cn-03	Obeys company rules and regulations even when no one is watching
	Sp-01	Consumes a lot of time complaining about trivial matters (R)
Civic virtue	Sp-02	Always focuses on what's wrong, rather than the positive side (R)
	Cv-01	Attends meetings that are not mandatory, but are considered important
Courtesy	Cv-02	Attends functions that are not required, but help the company image
	Cr-01	Takes steps to try to prevent problems with other workers
Altruism	Cr-02	Is mindful of how his/her behavior affects other people's jobs
	Cr-03	Does not abuse the rights of others
	Cr-04	Tries to avoid creating problems for coworkers
	Al-01	Helps others who have been absent
Ego-focused negative	Al-02	Helps others who have heavy work loads
	Al-03	Helps orient new people even though it is not required
	Al-04	Willingly helps others who have work related problems
	Al-05	Is always ready to lend a helping hand to those around him/her
Other-focused positive	EN-01	The individuals in the team usually feel unhappy
	EN-02	The individuals in the team usually feel unhappy
	EN-03	The individuals in the team are not very enthusiastic toward work
	EN-04	The individuals in the team often feel anxious
Ego-focused positive	OP-1	The members of the team have good relationships and get on well with each other
	OP-2	The dynamics among the members of the team are harmonious
	OP-3	This team is characterized by a relaxed, easy-going working climate
	OP-4	The members of the team can express their own opinions openly without fear of reprisal
Other-focused negative	EP-1	The individuals in the team feel energetic
	EP-2	The individuals in the team are optimistic and self-confident
	EP-3	The individuals in the team are vibrant
	EP-4	We are full of hope working in the team
Other-focused negative	ON-1	The members of the team don't share any personal feelings with others in the team
	ON-2	The atmosphere of the team is boring
	ON-3	The members of the team tend to be cool and aloof toward each other
	ON-4	It is hard for workgroup members to express our true thoughts directly in the team

1. Latar belakang Penelitian

Pengetahuan merupakan salah satu sumber daya organisasi paling signifikan yang akan menciptakan keunggulan kompetitif yang berkelanjutan dalam sebagian besar organisasi. Salah satu proses penting dan paling menantang dari manajemen pengetahuan adalah berbagi pengetahuan (*Knowledge Sharing* – KS). Berbagi pengetahuan dapat menghasilkan banyak perbaikan organisasi, sehingga memprediksi kecenderungan karyawan untuk berbagi pengetahuan diakui sebagai prioritas tinggi dari obsesi organisasi dalam ekonomi pengetahuan.

Meskipun pengetahuan dan berbagi pengetahuan dirasakan penting, manajer masih memiliki kesulitan untuk memaksa orang berbagi pengetahuan. Berbagi pengetahuan tidak akan terjadi jika orang tidak cenderung berbagi pengetahuan dengan rekan kerja atau anggota kelompok kerja lainnya. Selain itu, orang sering menganggap pengetahuan yang dimiliki sebagai alasan paling penting yang dibutuhkan organisasinya, sehingga lebih memilih untuk menimbunnya daripada membagikannya.

Untuk mengatasi masalah ini, daripada berfokus pada sistem penghargaan formal, yang merupakan insentif ekstrinsik, perilaku kewargaan organisasi (*Organizational Citizenship Behaviors* - OCB), sebagai motivasi intrinsik, dapat berperan dalam mendorong orang untuk berbagi pengetahuan dalam konteks organisasi. OCB diakui sebagai perilaku kerja bebas yang tidak terkait langsung dengan sistem penghargaan formal organisasi, tetapi dapat meningkatkan kinerja organisasi. Penelitian ini cenderung memberikan perhatian khusus pada kelompok OCB dan sub-konstruksinya untuk menguji sejauh mana kelompok tersebut dapat memprediksi KSB.

Di sisi lain, pengalaman empiris menunjukkan bahwa emosi memiliki dampak langsung pada perilaku orang. Penelitian tentang dampak iklim emosional kelompok kerja (*Workgroup Emotional Climate* - WEC) pada OCB dan KSB menunjukkan bahwa emosi memainkan peran penting dalam mendefinisikan perilaku orang dalam organisasi, melihat pengaruh lingkungan emosional kelompok kerja pada hubungan antara sub-konstruksi OCB dan KSB, serta mengidentifikasi alasan mengapa orang dengan tingkat OCB tinggi mungkin masih memilih untuk tidak berbagi pengetahuan.

Penelitian ini bertujuan untuk menguji sejauh mana pengaruh sub-konstruksi kelompok OCB yang meliputi: *altruisme*, *courtesy*, *civic virtue*, *conscientiousness*, dan *sportsmanship* dapat memprediksi perilaku KS (*Knowledge Sharing Behavior* - KSB) dengan memperhatikan efek WEC sebagai moderator hubungan antara kelompok OCB dan KSB.

2. Kerangka Teori

2.1. *Knowledge Sharing Behavior (KSB).*

Berbagi pengetahuan (*Knowledge Sharing - KS*) dicirikan sebagai seperangkat perilaku individu dalam melakukan pertukaran pengetahuan, pengalaman unik, dan bantuan kepada orang lain. Berbagi pengetahuan dianggap sebagai perilaku yang tidak dapat dipaksakan oleh manajer dan sistem tugas formal. Di sisi lain, berbagi pengetahuan memiliki sifat diskresioner, di mana individu tersebut akan memilih apakah ingin terlibat dalam berbagi pengetahuan dan seberapa banyak pengetahuan dan pengalaman yang ingin dibagikan. Karakteristik ini mirip dengan OCB.

2.2. *Group Organizational Citizenship Behavior (OCB)*

Karakterisasi kelompok OCB digambarkan sebagai keseluruhan perilaku anggota kelompok yang bebas, tidak secara langsung diakui oleh sistem penghargaan formal tetapi bermanfaat penting bagi kelompok dan secara umum meningkatkan kinerja organisasi. Efektivitas kelompok dapat terjadi oleh anggota kelompok yang terlibat dalam OCB seperti membantu rekan kerja untuk melakukan tugas dan memberikan saran yang berguna untuk meningkatkan kinerja kelompok.

2.3. Hubungan kelompok OCB dan KSB.

OCB berhubungan positif dengan KSB, individu dengan OCB yang lebih tinggi akan memiliki keinginan yang lebih untuk meningkatkan kesejahteraan orang lain; sehingga akan terbuka untuk berbagi pengetahuan dengan rekan kerja. KS dan OCB terkait erat karena kedua perilaku tersebut diperhitungkan sebagai perilaku diskresioner, dan keduanya memiliki hubungan positif dengan kinerja organisasi.

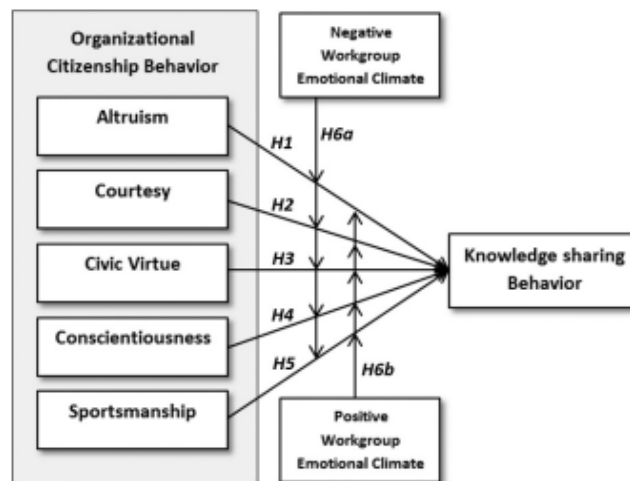

2.4. *Workgroup Emotional Climate (WEC).*

WEC diidentifikasi sebagai persepsi emosi dan pertukaran emosional yang mencirikan kelompok tertentu. Anggota kelompok kerja mengembangkan emosi bersama saat melakukan tugas, dan dengan demikian, pengalaman emosional tingkat individu bergabung untuk membentuk emosi agregat kelompok kerja. Kontribusi positif WEC dalam kinerja kelompok kerja, pada gilirannya akan berkontribusi pada kinerja organisasi.

3. Kerangka konseptual, hipotesis, dan model hipotesis

Terdapat lima komponen karakteristik kelompok OCB yang dirumuskan dalam penelitian ini, yaitu:

1. **Altruisme** adalah sikap atau naluri untuk memperhatikan dan mengutamakan kepentingan dan kebaikan orang lain.
2. **Courtesy** adalah perilaku individu untuk saling menghormati dan menjaga kehormatan (sopan santun).
3. **Civic virtue** adalah kemauan individu untuk menempatkan kepentingan umum di atas kepentingan pribadi.
4. **Conscientiousness** adalah individu yang memiliki sifat berhati-hati dalam segala tindakan atau melakukan pertimbangan yang matang untuk mengambil keputusan (kesadaran).
5. **Sportsmanship** adalah perilaku individu yang memiliki sikap sportif (keadilan dan kejujuran).

Gambar Model Hipotesis Penelitian

Rumusan model hipotesis penelitian yang dapat diuraikan sebagai berikut:

H1. *Altruisme* memiliki dampak positif pada KSB.

H2. *Courtesy* memiliki dampak positif pada KSB.

H3. *Civic virtue* memiliki dampak positif pada KSB.

H4. *Conscientiousness* memiliki dampak positif pada KSB.

H5. *Sportsmanship* memiliki dampak positif dalam KSB.

H6a. WEC negatif memoderasi hubungan antara komponen kelompok OCB dan KSB.

H6b. WEC positif memoderasi hubungan antara komponen kelompok OCB dan KSB.

4. Metode penelitian

Penelitian ini dilakukan berdasarkan strategi penelitian kuantitatif untuk mengetahui sejauh mana OCB dapat memprediksi perilaku KS. Untuk tujuan ini, langkah pertama setelah mengidentifikasi populasi adalah menentukan ukuran sampel untuk penelitian (Cohen, dikutip oleh [Hair et al., 2013](#)). Menggunakan metode random sampling, penelitian ini mensurvei 116 peserta.

Analisis data penelitian: 1) memeriksa kecukupan data dengan melakukan Kasier – Meyer – Olkin mengukur indeks kecukupan sampel (KMO), dan 2) memeriksa model pengukuran dan model struktural. Analisis KMO menghasilkan 0,826, yang secara signifikan lebih tinggi dari nilai ambang batas 0,7 ([George dan Mallery, 2003](#)). Oleh karena itu, hasilnya menegaskan bahwa kumpulan data memadai untuk melakukan analisis pemodelan persamaan struktural (*Structural Equation Modelling* - SEM). Analisis model pengukuran dan model struktural, menggunakan teknik pemodelan persamaan terkecil parsial (*Partial Least Equation Modeling* - PLS-SEM) melalui software Smart PLS V.2.3.6. Keunggulan PLS dalam menganalisis model penelitian yang rumit termasuk beberapa moderator ([Reinartz et al., 2009](#)).

Analisis faktor konfirmasi (CFA) diterapkan untuk mengevaluasi model pengukuran secara keseluruhan. Untuk mengevaluasi validitas model pengukuran, dilakukan analisis validitas konvergen dan diskriminan. Validitas konvergen adalah sejauh mana item yang digunakan untuk mengukur kesepakatan konseptual yang sama. Untuk menentukan validitas konvergen, validitas komposit (CR), rata-rata varians diekstraksi (AVE) dan faktor loading dihitung ([Hair et al., 1998](#)). Faktor pemuatan dan CR harus melebihi 0,7 ([Chin, 1998](#)) dan 0,5 adalah perpanjangan minimum yang dapat diterima untuk AVE ([Fornell dan Larcker, 1981](#)). Selain itu, untuk menilai validitas konvergen dari setiap konstruk, faktor pembebanan standar (pemuatan luar) dari setiap item dari setiap konstruk dihitung. Pembebanan direkomendasikan untuk melebihi 0,7 untuk validitas konvergen ([Anderson dan Gerbing, 1998](#) ; [Hair et al., 1998](#)). Validitas diskriminan juga harus diperiksa dalam model pengukuran. Ini mengacu pada sejauh mana faktor-faktor yang seharusnya mengukur konstruk spesifik tidak memprediksi kriteria yang tidak terkait secara konseptual ([John dan Benet-Martinez, 2000](#)). Untuk mengevaluasi validitas diskriminan, akar kuadrat dari AVE harus melebihi korelasi lintas konstruksi ([Fornell dan Larcker, 1981](#)). Validitas diskriminan dikonfirmasi setiap kali akar AVE antara setiap pasangan faktor lebih tinggi dari perkiraan korelasi antar faktor ([Hair et al., 2013](#)). Untuk penyelidikan lebih lanjut validitas diskriminan, indeks HTMT juga dihitung.

Pengujian model struktural dan hipotesis, penelitian ini menggunakan Smart PLS. Kriteria utama untuk penilaian model struktural adalah R^2 . Kriteria ini merepresentasikan besarnya varians yang dijelaskan dari setiap variabel laten endogen (Hair et al., 2012). Jumlah ini dikategorikan menjadi tiga tingkatan yaitu lemah (0,19), sedang (0,33) dan kuat (0,67) (Chin et al., 2003). Selanjutnya, blindfolding dijalankan untuk konstruk laten endogen dalam model untuk menghitung indeks Q2. Sementara jumlah $Q^2=0,248$, jauh lebih tinggi dari 0, kualitas prediksi model struktural dapat diterima (Hair et al., 2013).

Berikut indikator/pertanyaan yang dirumuskan untuk setiap variabel yang digunakan pada instrumen penelitian.

Measure	Item code	Question
Knowledge sharing	KS-01	When I've learned something, I tell my colleagues about it
	KS-02	When the have learnt something new, my colleagues tell me something about it
	KS-03	Knowledge sharing among colleagues is considered normal in my school
	KS-04	I share information with my colleagues when they ask for it
Conscientiousness	Cn-01	Attendance at work is above the norm
	Cn-02	Does not take extra breaks
	Cn-03	Obeys company rules and regulations even when no one is watching
Sportsmanship	Sp-01	Consumes a lot of time complaining about trivial matters (R)
	Sp-02	Always focuses on what's wrong, rather than the positive side (R)
Civic virtue	Cv-01	Attends meetings that are not mandatory, but are considered important
	Cv-02	Attends functions that are not required, but help the company image
Courtesy	Cr-01	Takes steps to try to prevent problems with other workers
	Cr-02	Is mindful of how his/her behavior affects other people's jobs
	Cr-03	Does not abuse the rights of others
	Cr-04	Tries to avoid creating problems for coworkers
Altruism	Al-01	Helps others who have been absent
	Al-02	Helps others who have heavy work loads
	Al-03	Helps orient new people even though it is not required
	Al-04	Willingly helps others who have work related problems
Ego-focused negative	Al-05	Is always ready to lend a helping hand to those around him/her
	EN-01	The individuals in the team usually feel unhappy
	EN-02	The individuals in the team usually feel unhappy
	EN-03	The individuals in the team are not very enthusiastic toward work
Other-focused positive	EN-04	The individuals in the team often feel anxious
	OP-1	The members of the team have good relationships and get on well with each other
	OP-2	The dynamics among the members of the team are harmonious
	OP-3	This team is characterized by a relaxed, easy-going working climate
Ego-focused positive	OP-4	The members of the team can express their own opinions openly without fear of reprisal
	EP-1	The individuals in the team feel energetic
	EP-2	The individuals in the team are optimistic and self-confident
	EP-3	The individuals in the team are vibrant
Other-focused negative	EP-4	We are full of hope working in the team
	ON-1	The members of the team don't share any personal feelings with others in the team
	ON-2	The atmosphere of the team is boring
	ON-3	The members of the team tend to be cool and aloof toward each other
	ON-4	It is hard for workgroup members to express our true thoughts directly in the team

5. Diskusi dan implikasi, kesimpulan, dan rekomendasi

Penelitian ini menguji sejauh mana pengaruh sub-konstruksi kelompok OCB yang meliputi: *altruisme*, *courtesy*, *civic virtue*, *conscientiousness*, dan *sportsmanship* dapat memprediksi terhadap KSB dengan memperhatikan efek WEC sebagai moderator hubungan antara kelompok OCB dan KSB. Hasil penelitian menyatakan bahwa hanya tiga dari lima sub-konstruksi OCB yang dapat memprediksi KSB di dalam atau di seluruh anggota kelompok kerja secara signifikan, yaitu *altruisme*, *conscientiousness*, dan *civic virtue* memiliki pengaruh yang signifikan terhadap KSB, sedangkan *courtesy* dan *sportsmanship* memiliki pengaruh yang tidak signifikan dengan KSB. Variabel *conscientiousness* memiliki pengaruh paling besar terhadap KSB. Selanjutnya, temuan menggambarkan bahwa WEC yang positif dan negatif akan menghambat atau meningkatkan KSB di antara orang-orang dengan tingkat *altruisme*, *civic virtue*, dan *conscientiousness* yang tinggi.

Altruisme mengacu pada kecenderungan seseorang mungkin harus membantu rekan-rekannya untuk mengatasi masalah tugas yang relevan. Oleh karena itu, tidak heran jika seseorang yang memiliki *altruisme* tinggi memiliki kecenderungan yang lebih besar untuk membagi ilmunya guna mengatasi permasalahan terkait pekerjaan seseorang yang muncul karena kurangnya pengetahuan. Pengetahuan adalah sumber daya yang berharga; Namun, hasil penelitian mengungkapkan bahwa *altruisme*, sebagai prediktor berbagi pengetahuan, menyebabkan seseorang untuk berbagi ilmu secara mandiri untuk kesejahteraan orang lain. Hubungan ini ditegaskan oleh peneliti lain (Lin, 2008).

Sub-konstruksi OCB lain yang diteliti dalam penelitian ini adalah *conscientiousness*. Konstruksi ini dicirikan sebagai jujur dan setia di tempat kerja. Orang seperti itu mematuhi aturan dan peraturan organisasi dengan ketat. Jika KSB didefinisikan sebagai kebijakan organisasi, *conscientiousness* mengikutinya dengan ketat. Temuan Farh dkk. (2004) menyimpulkan adanya hubungan antara *conscientiousness* dan KSB.

Yang terakhir, tetapi sub-konstruksi OCB penting yang sama, yang memprediksi KSB adalah *civic virtue*. Faktor ini berarti melampaui tugas wajib, serta merangkul perubahan organisasi. Sementara KSB adalah bagian dari pekerjaan, beberapa orang mungkin menganggapnya sebagai pekerjaan tambahan dan itu dapat mengakibatkan tidak berpartisipasi secara aktif di dalamnya. Berdasarkan temuan penelitian ini diasumsikan bahwa orang dengan niat *civic virtue* yang tinggi dapat melampaui tugas rutin yang ditentukan dan melakukan KSB, bahkan jika itu bukan bagian dari tugas

biasa. Hubungan antara *civic virtue* dan KSB dipertahankan oleh para ilmuwan lain, seperti [Ramasamy dan Thamaraiselvan \(2011\)](#).

Hasil analisis data yang dikumpulkan untuk penelitian menyangkal kemampuan *courtesy* dan *sportsmanship* dalam memprediksi KSB. *Courtesy* berarti menyadari konsekuensi dari perilaku seseorang terhadap kehidupan orang lain. Meskipun pengetahuan seseorang mungkin memiliki efek positif pada kehidupan kerja orang lain; namun, temuan tersebut menyangkal peran motivasional dari *courtesy* untuk secara efektif mengejar orang untuk berbagi pengetahuan dalam konteks organisasi. Kesimpulan ini bertentangan dengan hasil beberapa ilmuwan; Namun demikian, [Dehghani dkk. \(2015\)](#) mengungkapkan bahwa budaya dapat memoderasi hubungan antara *courtesy* dan KSB.

Sub-konstruksi OCB terakhir yang gagal diterima sebagai prediktor signifikan KSB adalah *sportsmanship*, artinya tidak fokus pada masalah kecil organisasi. *Sportsmanship* tidak diakui sebagai alasan untuk mempengaruhi KSB. Temuan konvensional ini dapat dibantah oleh beberapa penelitian seperti [Lin \(2008\)](#); Meski demikian, mengingat konsep *sportsmanship*, maju tanpa mengeluh, tampaknya tidak terkait langsung dengan kecenderungan penyelenggaraan KSB ([Dehghani et al., 2015](#)).

Temuan juga berpendapat bahwa iklim emosional yang dominan dari kelompok kerja dapat mempengaruhi hubungan antara beberapa sub-konstruksi OCB dan KSB di antara kelompok kerja. Dalam hal ini, WEC yang positif meningkatkan hubungan antara konstruksi yang disebutkan dan KSB, sedangkan WEC yang negatif bertindak secara negatif. Sejalan dengan itu, semakin positif iklim emosional yang dikembangkan dalam organisasi, semakin banyak KSB yang akan diamati. Meninjau literatur terkait, penelitian tentang dampak WEC pada hubungan antara sub-konstruksi kelompok OCB dan KSB dilakukan oleh [William et al., \(2013\)](#) dan [Matej et al., \(2014\)](#) yang hasilnya menekankan pentingnya kondisi emosional individu dalam kelompok kerja dan organisasi, yang dapat mempengaruhi perilaku dasar seperti OCB ([Liu et al., 2014](#)) dan KSB.

Temuan penelitian ini memiliki implikasi praktis. Mengingat pentingnya berbagi pengetahuan dalam ekonomi pengetahuan saat ini, dengan memahami pengaruh sub-konstruksi OCB pada berbagi pengetahuan, manajer akan meningkatkan berbagi pengetahuan organisasi dengan mengembangkan budaya yang mendorong *altruism*, *civic virtue* dan *conscientiousness* sebagai pengganti pembayaran insentif. Selain itu, mempromosikan iklim yang mendukung secara emosional mendorong berbagi pengetahuan di antara orang-orang.

Studi ini membuat tiga tambahan berbeda pada literatur berbagi pengetahuan. Pertama, meskipun ada sedikit penelitian yang menyelidiki hubungan antara OCB dan KS, beberapa dari mereka meneliti efek dari sub-konstruksi OCB pada KSB. Kedua, ini adalah salah satu studi pertama yang meneliti peran moderasi WEC mengenai berbagi pengetahuan. Ketiga, memeriksa pengaruh sub-konstruksi OCB pada KS di sektor publik Iran akan berkontribusi pada literatur dengan memperluas pemeriksaan konstruksi dalam konteks yang berbeda.

Penelitian ini mencakup beberapa keterbatasan, yang dapat diatasi dalam penelitian masa depan. Pertama, berbagi pengetahuan yang sebenarnya akan lebih baik diamati daripada disurvei dengan kuesioner (Lin dan Ding, 2003). Menggunakan alat pengumpulan data lainnya, seperti observasi, akan meningkatkan kualitas temuan. Kedua, penelitian ini mensurvei karyawan hanya di satu organisasi. Dengan demikian, generalisasi temuan mungkin terbatas. Disarankan agar peneliti menyelidiki temuan ini di organisasi lain dan mengevaluasi kemungkinan perbedaannya. Keterbatasan ketiga adalah bahwa beberapa variabel lain, seperti kepuasan kerja, budaya organisasi, kerja paruh waktu atau penuh waktu, jenis kelamin, dll., tidak ditangani sebagai variabel kontrol. Penelitian selanjutnya harus berusaha untuk mengatasi keterbatasan dan kekurangan lainnya dengan mengambil variabel-variabel tersebut sebagai moderator yang berperan dalam hubungan antara OCB dan KSB. Akhirnya, sebagai implikasi teoretis lain, mengingat pentingnya dan pengaruh iklim emosional pada KS, peneliti *Knowledge Management* (KM) dapat mempelajari konsekuensi yang berbeda dari konstruk ini pada manajemen pengetahuan.

1. Latar belakang Penelitian

Pengetahuan merupakan salah satu sumber daya organisasi paling signifikan yang akan menciptakan keunggulan kompetitif yang berkelanjutan dalam sebagian besar organisasi. Salah satu proses penting dan paling menantang dari manajemen pengetahuan adalah berbagi pengetahuan (*Knowledge Sharing* – KS). Berbagi pengetahuan dapat menghasilkan banyak perbaikan organisasi, sehingga memprediksi kecenderungan karyawan untuk berbagi pengetahuan diakui sebagai prioritas tinggi dari obsesi organisasi dalam ekonomi pengetahuan.

Meskipun pengetahuan dan berbagi pengetahuan dirasakan penting, manajer masih memiliki kesulitan untuk memaksa orang berbagi pengetahuan. Berbagi pengetahuan tidak akan terjadi jika orang tidak cenderung berbagi pengetahuan dengan rekan kerja atau anggota kelompok kerja lainnya. Selain itu, orang sering menganggap pengetahuan yang dimiliki sebagai alasan paling penting yang dibutuhkan organisasinya, sehingga lebih memilih untuk menimbunnya daripada membagikannya.

Untuk mengatasi masalah ini, daripada berfokus pada sistem penghargaan formal, yang merupakan insentif ekstrinsik, perilaku kewargaan organisasi (*Organizational Citizenship Behaviors* - OCB), sebagai motivasi intrinsik, dapat berperan dalam mendorong orang untuk berbagi pengetahuan dalam konteks organisasi. OCB diakui sebagai perilaku kerja bebas yang tidak terkait langsung dengan sistem penghargaan formal organisasi, tetapi dapat meningkatkan kinerja organisasi. Penelitian ini cenderung memberikan perhatian khusus pada kelompok OCB dan sub-konstruksinya untuk menguji sejauh mana kelompok tersebut dapat memprediksi KSB.

Di sisi lain, pengalaman empiris menunjukkan bahwa emosi memiliki dampak langsung pada perilaku orang. Penelitian tentang dampak iklim emosional kelompok kerja (*Workgroup Emotional Climate* - WEC) pada OCB dan KSB menunjukkan bahwa emosi memainkan peran penting dalam mendefinisikan perilaku orang dalam organisasi, melihat pengaruh lingkungan emosional kelompok kerja pada hubungan antara sub-konstruksi OCB dan KSB, serta mengidentifikasi alasan mengapa orang dengan tingkat OCB tinggi mungkin masih memilih untuk tidak berbagi pengetahuan.

Penelitian ini bertujuan untuk menguji sejauh mana pengaruh sub-konstruksi kelompok OCB yang meliputi: *altruisme*, *courtesy*, *civic virtue*, *conscientiousness*, dan *sportsmanship* dapat memprediksi perilaku KS (*Knowledge Sharing Behavior* - KSB) dengan memperhatikan efek WEC sebagai moderator hubungan antara kelompok OCB dan KSB.

2. Kerangka Teori

2.1. *Knowledge Sharing Behavior* (KSB).

Berbagi pengetahuan (*Knowledge Sharing - KS*) dicirikan sebagai seperangkat perilaku individu dalam melakukan pertukaran pengetahuan, pengalaman unik, dan bantuan kepada orang lain. Berbagi pengetahuan dianggap sebagai perilaku yang tidak dapat dipaksakan oleh manajer dan sistem tugas formal. Di sisi lain, berbagi pengetahuan memiliki sifat diskresioner, di mana individu tersebut akan memilih apakah ingin terlibat dalam berbagi pengetahuan dan seberapa banyak pengetahuan dan pengalaman yang ingin dibagikan. Karakteristik ini mirip dengan OCB.

2.2. *Group Organizational Citizenship Behavior* (OCB)

Karakterisasi kelompok OCB digambarkan sebagai keseluruhan perilaku anggota kelompok yang bebas, tidak secara langsung diakui oleh sistem penghargaan formal tetapi bermanfaat penting bagi kelompok dan secara umum meningkatkan kinerja organisasi. Efektivitas kelompok dapat terjadi oleh anggota kelompok yang terlibat dalam OCB seperti membantu rekan kerja untuk melakukan tugas dan memberikan saran yang berguna untuk meningkatkan kinerja kelompok.

2.3. Hubungan kelompok OCB dan KSB.

OCB berhubungan positif dengan KSB, individu dengan OCB yang lebih tinggi akan memiliki keinginan yang lebih untuk meningkatkan kesejahteraan orang lain; sehingga akan terbuka untuk berbagi pengetahuan dengan rekan kerja. KS dan OCB terkait erat karena kedua perilaku tersebut diperhitungkan sebagai perilaku diskresioner, dan keduanya memiliki hubungan positif dengan kinerja organisasi.

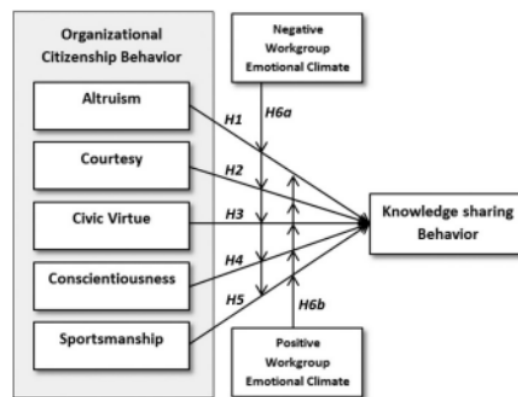

2.4. *Workgroup Emotional Climate* (WEC).

WEC diidentifikasi sebagai persepsi emosi dan pertukaran emosional yang mencirikan kelompok tertentu. Anggota kelompok kerja mengembangkan emosi bersama saat melakukan tugas, dan dengan demikian, pengalaman emosional tingkat individu bergabung untuk membentuk emosi agregat kelompok kerja. Kontribusi positif WEC dalam kinerja kelompok kerja, pada gilirannya akan berkontribusi pada kinerja organisasi.

3. Kerangka konseptual, hipotesis, dan model hipotesis

Terdapat lima komponen karakteristik kelompok OCB yang dirumuskan dalam penelitian ini, yaitu:

1. **Altruisme** adalah sikap atau naluri untuk memperhatikan dan mengutamakan kepentingan dan kebaikan orang lain.
2. **Courtesy** adalah perilaku individu untuk saling menghormati dan menjaga kehormatan (sopan santun).
3. **Civic virtue** adalah kemauan individu untuk menempatkan kepentingan umum di atas kepentingan pribadi.
4. **Conscientiousness** adalah individu yang memiliki sifat berhati-hati dalam segala tindakan atau melakukan pertimbangan yang matang untuk mengambil keputusan (kesadaran).
5. **Sportsmanship** adalah perilaku individu yang memiliki sikap sportif (keadilan dan kejujuran).

Gambar Model Hipotesis Penelitian

Rumusan model hipotesis penelitian yang dapat diuraikan sebagai berikut:

- H1. *Altruisme* memiliki dampak positif pada KSB.
H2. *Courtesy* memiliki dampak positif pada KSB.
H3. *Civic virtue* memiliki dampak positif pada KSB.
H4. *Conscientiousness* memiliki dampak positif pada KSB.
H5. *Sportsmanship* memiliki dampak positif dalam KSB.
H6a. WEC negatif memoderasi hubungan antara komponen kelompok OCB dan KSB.
H6b. WEC positif memoderasi hubungan antara komponen kelompok OCB dan KSB.

4. Metode penelitian

Penelitian ini dilakukan berdasarkan strategi penelitian kuantitatif untuk mengetahui sejauh mana OCB dapat memprediksi perilaku KS. Untuk tujuan ini, langkah pertama setelah mengidentifikasi populasi adalah menentukan ukuran sampel untuk penelitian (Cohen, dikutip oleh Hair et al., 2013). Menggunakan metode random sampling, penelitian ini mensurvei 116 peserta.

Analisis data penelitian: 1) memeriksa kecukupan data dengan melakukan Kasier – Meyer – Olkin mengukur indeks kecukupan sampel (KMO), dan 2) memeriksa model pengukuran dan model struktural. Analisis KMO menghasilkan 0,826, yang secara signifikan lebih tinggi dari nilai ambang batas 0,7 (George dan Mallery, 2003). Oleh karena itu, hasilnya menegaskan bahwa kumpulan data memadai untuk melakukan analisis pemodelan persamaan struktural (*Structural Equation Modelling* - SEM). Analisis model pengukuran dan model struktural, menggunakan teknik pemodelan persamaan terkecil parsial (*Partial Least Equation Modeling* - PLS-SEM) melalui software Smart PLS V.2.3.6. Keunggulan PLS dalam menganalisis model penelitian yang rumit termasuk beberapa moderator (Reinartz et al., 2009).

Analisis faktor konfirmasi (CFA) diterapkan untuk mengevaluasi model pengukuran secara keseluruhan. Untuk mengevaluasi validitas model pengukuran, dilakukan analisis validitas konvergen dan diskriminan. Validitas konvergen adalah sejauh mana item yang digunakan untuk mengukur kesepakatan konseptual yang sama. Untuk menentukan validitas konvergen, validitas komposit (CR), rata-rata varians diekstraksi (AVE) dan faktor loading dihitung (Hair et al., 1998). Faktor pemuatan dan CR harus melebihi 0,7 (Chin, 1998) dan 0,5 adalah perpanjangan minimum yang dapat diterima untuk AVE (Fornell dan Larcker, 1981). Selain itu, untuk menilai validitas konvergen dari setiap konstruk, faktor pembebanan standar (pemuatan luar) dari setiap item dari setiap konstruk dihitung. Pembebanan direkomendasikan untuk melebihi 0,7 untuk validitas konvergen (Anderson dan Gerbing, 1998 ; Hair et al., 1998). Validitas diskriminan juga harus diperiksa dalam model pengukuran. Ini mengacu pada sejauh mana faktor-faktor yang seharusnya mengukur konstruk spesifik tidak memprediksi kriteria yang tidak terkait secara konseptual (John dan Benet-Martinez, 2000). Untuk mengevaluasi validitas diskriminan, akar kuadrat dari AVE harus melebihi korelasi lintas konstruksi (Fornell dan Larcker, 1981). Validitas diskriminan dikonfirmasi setiap kali akar AVE antara setiap pasangan faktor lebih tinggi dari perkiraan korelasi antar faktor (Hair et al., 2013). Untuk penyelidikan lebih lanjut validitas diskriminan, indeks HTMT juga dihitung.

Pengujian model struktural dan hipotesis, penelitian ini menggunakan Smart PLS. Kriteria utama untuk penilaian model struktural adalah R^2 . Kriteria ini merepresentasikan besarnya varians yang dijelaskan dari setiap variabel laten endogen (Hair et al., 2012). Jumlah ini dikategorikan menjadi tiga tingkatan yaitu lemah (0,19), sedang (0,33) dan kuat (0,67) (Chin et al., 2003). Selanjutnya, blindfolding dijalankan untuk konstruk laten endogen dalam model untuk menghitung indeks Q2. Sementara jumlah $Q^2=0,248$, jauh lebih tinggi dari 0, kualitas prediksi model struktural dapat diterima (Hair et al., 2013).

Berikut indikator/pertanyaan yang dirumuskan untuk setiap variabel yang digunakan pada instrumen penelitian.

Measure	Item code	Question
Knowledge sharing	KS-01	When I've learned something, I tell my colleagues about it
	KS-02	When the have learnt something new, my colleagues tell me something about it
	KS-03	Knowledge sharing among colleagues is considered normal in my school
	KS-04	I share information with my colleagues when they ask for it
Conscientiousness	Cn-01	Attendance at work is above the norm
	Cn-02	Does not take extra breaks
	Cn-03	Obeys company rules and regulations even when no one is watching
Sportsmanship	Sp-01	Consumes a lot of time complaining about trivial matters (R)
	Sp-02	Always focuses on what's wrong, rather than the positive side (R)
Civic virtue	Cv-01	Attends meetings that are not mandatory, but are considered important
	Cv-02	Attends functions that are not required, but help the company image
Courtesy	Cr-01	Takes steps to try to prevent problems with other workers
	Cr-02	Is mindful of how his/her behavior affects other people's jobs
	Cr-03	Does not abuse the rights of others
Altruism	Cr-04	Tries to avoid creating problems for coworkers
	Al-01	Helps others who have been absent
	Al-02	Helps others who have heavy work loads
	Al-03	Helps orient new people even though it is not required
	Al-04	Willingly helps others who have work related problems
Ego-focused negative	Al-05	Is always ready to lend a helping hand to those around him/her
	EN-01	The individuals in the team usually feel unhappy
	EN-02	The individuals in the team usually feel unhappy
	EN-03	The individuals in the team are not very enthusiastic toward work
Other-focused positive	EN-04	The individuals in the team often feel anxious
	OP-1	The members of the team have good relationships and get on well with each other
	OP-2	The dynamics among the members of the team are harmonious
	OP-3	This team is characterized by a relaxed, easy-going working climate
Ego-focused positive	OP-4	The members of the team can express their own opinions openly without fear of reprisal
	EP-1	The individuals in the team feel energetic
	EP-2	The individuals in the team are optimistic and self-confident
	EP-3	The individuals in the team are vibrant
Other-focused negative	EP-4	We are full of hope working in the team
	ON-1	The members of the team don't share any personal feelings with others in the team
	ON-2	The atmosphere of the team is boring
	ON-3	The members of the team tend to be cool and aloof toward each other
	ON-4	It is hard for workgroup members to express our true thoughts directly in the team

5. Diskusi dan implikasi, kesimpulan, dan rekomendasi

Penelitian ini menguji sejauh mana pengaruh sub-konstruksi kelompok OCB yang meliputi: *altruisme*, *courtesy*, *civic virtue*, *conscientiousness*, dan *sportsmanship* dapat memprediksi terhadap KSB dengan memperhatikan efek WEC sebagai moderator hubungan antara kelompok OCB dan KSB. Hasil penelitian menyatakan bahwa hanya tiga dari lima sub-konstruksi OCB yang dapat memprediksi KSB di dalam atau di seluruh anggota kelompok kerja secara signifikan, yaitu *altruisme*, *conscientiousness*, dan *civic virtue* memiliki pengaruh yang signifikan terhadap KSB, sedangkan *courtesy* dan *sportsmanship* memiliki pengaruh yang tidak signifikan dengan KSB. Variabel *conscientiousness* memiliki pengaruh paling besar terhadap KSB. Selanjutnya, temuan menggambarkan bahwa WEC yang positif dan negatif akan menghambat atau meningkatkan KSB di antara orang-orang dengan tingkat *altruisme*, *civic virtue*, dan *conscientiousness* yang tinggi.

Altruisme mengacu pada kecenderungan seseorang mungkin harus membantu rekan-rekannya untuk mengatasi masalah tugas yang relevan. Oleh karena itu, tidak heran jika seseorang yang memiliki *altruisme* tinggi memiliki kecenderungan yang lebih besar untuk membagi ilmunya guna mengatasi permasalahan terkait pekerjaan seseorang yang muncul karena kurangnya pengetahuan. Pengetahuan adalah sumber daya yang berharga; Namun, hasil penelitian mengungkapkan bahwa *altruisme*, sebagai prediktor berbagi pengetahuan, menyebabkan seseorang untuk berbagi ilmu secara mandiri untuk kesejahteraan orang lain. Hubungan ini ditegaskan oleh peneliti lain (Lin, 2008).

Sub-konstruksi OCB lain yang diteliti dalam penelitian ini adalah *conscientiousness*. Konstruksi ini dicirikan sebagai jujur dan setia di tempat kerja. Orang seperti itu mematuhi aturan dan peraturan organisasi dengan ketat. Jika KSB didefinisikan sebagai kebijakan organisasi, *conscientiousness* mengikutinya dengan ketat. Temuan Farh dkk. (2004) menyimpulkan adanya hubungan antara *conscientiousness* dan KSB.

Yang terakhir, tetapi sub-konstruksi OCB penting yang sama, yang memprediksi KSB adalah *civic virtue*. Faktor ini berarti melampaui tugas wajib, serta merangkul perubahan organisasi. Sementara KSB adalah bagian dari pekerjaan, beberapa orang mungkin menganggapnya sebagai pekerjaan tambahan dan itu dapat mengakibatkan tidak berpartisipasi secara aktif di dalamnya. Berdasarkan temuan penelitian ini diasumsikan bahwa orang dengan niat *civic virtue* yang tinggi dapat melampaui tugas rutin yang ditentukan dan melakukan KSB, bahkan jika itu bukan bagian dari tugas

biasa. Hubungan antara *civic virtue* dan KSB dipertahankan oleh para ilmuwan lain, seperti [Ramasamy dan Thamaraiselvan \(2011\)](#).

Hasil analisis data yang dikumpulkan untuk penelitian menyangkal kemampuan *courtesy* dan *sportsmanship* dalam memprediksi KSB. *Courtesy* berarti menyadari konsekuensi dari perilaku seseorang terhadap kehidupan orang lain. Meskipun pengetahuan seseorang mungkin memiliki efek positif pada kehidupan kerja orang lain; namun, temuan tersebut menyangkal peran motivasional dari *courtesy* untuk secara efektif mengejar orang untuk berbagi pengetahuan dalam konteks organisasi. Kesimpulan ini bertentangan dengan hasil beberapa ilmuwan; Namun demikian, [Dehghani dkk. \(2015\)](#) mengungkapkan bahwa budaya dapat memoderasi hubungan antara *courtesy* dan KSB.

Sub-konstruksi OCB terakhir yang gagal diterima sebagai prediktor signifikan KSB adalah *sportsmanship*, artinya tidak fokus pada masalah kecil organisasi. *Sportsmanship* tidak diakui sebagai alasan untuk mempengaruhi KSB. Temuan konvensional ini dapat dibantah oleh beberapa penelitian seperti [Lin \(2008\)](#); Meski demikian, mengingat konsep *sportsmanship*, maju tanpa mengeluh, tampaknya tidak terkait langsung dengan kecenderungan penyelenggaraan KSB ([Dehghani et al., 2015](#)).

Temuan juga berpendapat bahwa iklim emosional yang dominan dari kelompok kerja dapat mempengaruhi hubungan antara beberapa sub-konstruksi OCB dan KSB di antara kelompok kerja. Dalam hal ini, WEC yang positif meningkatkan hubungan antara konstruksi yang disebutkan dan KSB, sedangkan WEC yang negatif bertindak secara negatif. Sejalan dengan itu, semakin positif iklim emosional yang dikembangkan dalam organisasi, semakin banyak KSB yang akan diamati. Meninjau literatur terkait, penelitian tentang dampak WEC pada hubungan antara sub-konstruksi kelompok OCB dan KSB dilakukan oleh [William et al., \(2013\)](#) dan [Matej et al., \(2014\)](#) yang hasilnya menekankan pentingnya kondisi emosional individu dalam kelompok kerja dan organisasi, yang dapat mempengaruhi perilaku dasar seperti OCB ([Liu et al., 2014](#)) dan KSB.

Temuan penelitian ini memiliki implikasi praktis. Mengingat pentingnya berbagi pengetahuan dalam ekonomi pengetahuan saat ini, dengan memahami pengaruh sub-konstruksi OCB pada berbagi pengetahuan, manajer akan meningkatkan berbagi pengetahuan organisasi dengan mengembangkan budaya yang mendorong *altruism*, *civic virtue* dan *conscientiousness* sebagai pengganti pembayaran insentif. Selain itu, mempromosikan iklim yang mendukung secara emosional mendorong berbagi pengetahuan di antara orang-orang.

Studi ini membuat tiga tambahan berbeda pada literatur berbagi pengetahuan. Pertama, meskipun ada sedikit penelitian yang menyelidiki hubungan antara OCB dan KS, beberapa dari mereka meneliti efek dari sub-konstruksi OCB pada KSB. Kedua, ini adalah salah satu studi pertama yang meneliti peran moderasi WEC mengenai berbagi pengetahuan. Ketiga, memeriksa pengaruh sub-konstruksi OCB pada KS di sektor publik Iran akan berkontribusi pada literatur dengan memperluas pemeriksaan konstruksi dalam konteks yang berbeda.

Penelitian ini mencakup beberapa keterbatasan, yang dapat diatasi dalam penelitian masa depan. Pertama, berbagi pengetahuan yang sebenarnya akan lebih baik diamati daripada disurvei dengan kuesioner (Lin dan Ding, 2003). Menggunakan alat pengumpulan data lainnya, seperti observasi, akan meningkatkan kualitas temuan. Kedua, penelitian ini mensurvei karyawan hanya di satu organisasi. Dengan demikian, generalisasi temuan mungkin terbatas. Disarankan agar peneliti menyelidiki temuan ini di organisasi lain dan mengevaluasi kemungkinan perbedaannya. Keterbatasan ketiga adalah bahwa beberapa variabel lain, seperti kepuasan kerja, budaya organisasi, kerja paruh waktu atau penuh waktu, jenis kelamin, dll., tidak ditangani sebagai variabel kontrol. Penelitian selanjutnya harus berusaha untuk mengatasi keterbatasan dan kekurangan lainnya dengan mengambil variabel-variabel tersebut sebagai moderator yang berperan dalam hubungan antara OCB dan KSB. Akhirnya, sebagai implikasi teoretis lain, mengingat pentingnya dan pengaruh iklim emosional pada KS, peneliti *Knowledge Management* (KM) dapat mempelajari konsekuensi yang berbeda dari konstruk ini pada manajemen pengetahuan.
